

Scanning the World's Microfilm!

October 23, 2012. SunRise Imaging supplies The National Library of the Netherlands

Steven Godfrey, Commercial Director of SunRise EMEA recently received the following email from the National Library of the Netherlands (Koninklijke Bibliotheek):

“After extensive testing and product research by the KB, the SunRise Apollo HS scanning system was chosen as the best overall scanner for digitizing the Libraries extensive archive of microfilms. The key factors in our decision were the quality of the scans produced by these scanners as it is in accordance with the library Metamorphose specifications, even on reduction ratio 22”.

“The scanner operators are able to adjust the scans to specific needs offering us considerable flexibility with differing film types. We did find that we needed training to work with the scanners because of our film complexity but that’s a good thing because now after having received high quality training direct from SunRise we have our own in-house expertise”.

“The service Sunrise imaging provides is very good and they offer all the input when needed. After some starting problems, which were solved in a satisfactory manner, the scanners produced according to our expectations with no further issues. The KB has been using the two scanners now since July 2011 and we find them to be reliable”.
